Climate change is now a major concern. The polar ice caps are reported to be melting and sea levels are rising due to an increase in the average temperature of the Earth's atmosphere and oceans. Global warming is driven by increasing levels of tropospheric gases that contribute to the so-called greenhouse effect.

The cause of the trend is a puzzle. Physics demands that water expand as its temperature increases. But to keep the rate of rise constant, as observed, expansion of sea water evidently must be offset by something else.

Organic-inorganic perovskite solar cells have recently emerged at the forefront of photovoltaics research.

Power conversion efficiencies have experienced an unprecedented increase to reported values exceeding 19% within just four years.

I frequently see the assertion made that infrared (IR) radiation cannot warm a water body because IR only affects the skin (microns of water depth), whereas solar radiation is absorbed over water depths of meters to tens of meters.
